

CONTENTS

1. Introduction

2. Scientific space projects of the Federal Space Programme of Russia

- 2.1. “CORONAS-F” Project
- 2.2. The BURST Project (Konus-Wind and Konus-A Experiments)
- 2.3. The MSP-2001 Project (HEND Experiment)
- 2.4. Project “RIM-PAMELA” (Russian-Italian Mission)
- 2.5. “CORONAS-PHOTON” Project
- 2.6. “SPECTR-R” Project (Mission “RADIOASTRON”)
- 2.7. “PHOBOS-SOIL” Mission
- 2.8. The SPECTRUM-UV Project (the World Space Observatory)
- 2.9. “SPECTRUM-X-GAMMA” Project
- 2.10. “RESONANCE” Project
- 2.11. “BIOCOSMOS-1” Project
- 2.12. The “NUCLON” Project
- 2.13. The “GAMMA-400” Project
- 2.14. “MILLIMETRON” Project
- 2.15. “ASTROMETER” Project (space astrometrical arc-measuring-interferometer)

3. Scientific results on the basic directions of fundamental space research

3.1. Space Biology and Physiology

3.1.1. Space Biology and Physiology

- 3.1.1.1. Role of support afferentation in control of tonic muscle activity
- 3.1.1.2. Biochemical Markers of Bone Tissue Metabolism in Cosmonauts after a Prolonged Spaceflight
- 3.1.1.3. Results of Microbiological Studies of the Environment of the International Space Station
- 3.1.1.4. Spaceflight effects on consecutive generations of peas grown onboard the Russian segment of the International Space Station
- 3.1.1.5. Effects of space station conditions (ISS) on resting egg and life cycle in *D. magna* and *S. torvicornis*

3.1.2. Geliobiology

- 3.1.2.1. Rhythms of helio-geomagnetic activity as an external synchronizers
- 3.1.2.2. New scenario for the prebiologic stage of evolution and the universal mechanism of its realization

3.2. Materials Processing in Space

- 3.2.1. Effects of variable microaccelerations in distribution of impurity inhomogeneities in the InSb:Te single crystals grown by crucibleless floating zone melting on the “Foton” satellite
- 3.2.2. Developing of new method of crystal growth in microgravity
- 3.2.3. Effects of Melt Structural Self-organization within the Transient Layer during Crystal Growth in Microgravity

3.3. Earth Observation

- 3.3.1. Information system of operational data in NTs OMZ (TERRA-MODIS data processing)
- 3.3.2. Investigation of the solar wind using radio sounding method
- 3.3.3. Development of radio occultation technique for global monitoring of the Earth atmosphere and ionosphere by use of satellite-to-satellite links

3.4. Physics of Space Plasma and Solar-Terrestrial Interactions

- 3.4.1. The CORONAS space mission
- 3.4.2. Earth and Solar Physics
 - 3.4.2.1. Multispacecraft exploration of the ion acceleration in magnetosphere. Multiplet structure of the acceleration processes

- 3.4.2.2. Theoretical modeling of self-consistent thin current sheets in the Earth's magnetosphere
- 3.4.2.3. Oscillatory magnetic flux tube slippage in the plasma sheet
- 3.4.2.4. The properties of the solar wind discontinuities from simultaneous observations by five spacecraft (INTERBALL, WIND, ACE, GEOTAIL, IMP8)
- 3.4.2.5. The extensive experimental material concerning extremely active phenomena in October–November, 2003 and in November, 2004 is collected and analysed
- 3.4.2.6. Dependence of O⁺ ionospheric ions outflow in the polar cap on polar rain intensity
- 3.4.2.7. Solar energetic particle in the polar heliospheric regions
- 3.4.2.8. Electron observations in the Low latitude boundary layer (LLBL) by Interball Tail satellite
- 3.4.2.9. Solar Wind Exploration
- 3.5. Studies of Planets and Small Bodies of the Solar System**
 - 3.5.1. Planets Exploration
 - 3.5.1.1. Discovery of an aurora on Mars. SPICAM Mars Express
 - 3.5.1.2. The observation of nightglow in the upper atmosphere of Mars: the NO bands in UV and implications for atmospheric transport. SPICAM Mars Express
 - 3.5.1.3. Gravity waves and the CO₂ clouds in the polar region at late winter. OMEGA and PFS Mars Express
 - 3.5.1.4. Ozone vertical profiles from OMEGA limb measurements
 - 3.5.1.5. Seasonal variation of the thermal structure of the Martian atmosphere
 - 3.5.1.6. Dust and water ice clouds. PFS Mars Express
 - 3.5.1.7. Research of the current Martian climate with Mars general circulation model
 - 3.5.1.8. The model of charging and coagulation processes in Titan tholin haze
 - 3.5.1.9. Russian experiment HEND onboard NASA Mars Odyssey
- 3.6. Extra Atmospheric Astronomy**
 - 3.6.1. The GAMMA-400 PROJECT. Direct measurements of the primary gamma-radiation in the energy range 30 GeV – 1 TeV
 - 3.6.1.1. Telescope GAMMA-400 has basically ordinary structure. It consists of following systems
 - 3.6.1.2. GAMMA-400 telescope possesses some specific features
 - 3.6.1.3. Present status of the GAMMA-400 project
 - 3.6.2. Astrophysics
 - 3.6.2.1. Several important astrophysical studies were made by Russian astrophysicist during two years of observations of INTEGRAL — joint ESA, Russia and NASA gamma-ray observatory
 - 3.6.2.2. Theoretical and experimental researches at high energy astrophysics
 - 3.6.3. Studies of Cosmic Gamma-Ray Bursts and Transient Sources in the Konus and Helicon Experiments
 - 3.6.3.1. Experimental procedure
 - 3.6.3.2. Studies of temporal profiles, energy spectra, and spectral variability of cosmic gamma-ray bursts
 - 3.6.3.3. The role of the Konus-Wind experiment in multi-wavelength studies of cosmic gamma-ray bursts
 - 3.6.3.4. Studies of soft gamma repeaters. giant burst from SGR1806-20 repeater and its compton backscattering from the Moon
 - 3.6.3.5. A new kind of activity of the Cygnus X-1 source
 - 3.6.3.6. Conclusion
- 3.7. Space Ray Physics**
 - 3.7.1. The results of experimental investigations of Space processes
 - 3.7.2. Results of theoretical investigations and modeling of processes on the Sun, in interplanetary medium and the magnetospheres of the Earth and planets of solar system
 - 3.7.3. Results of the analysis of satellite data
